

Distributed Machine Monitoring

Whispering to machines

The Swiss company Quinx AG is part of a group of pioneers that are into network based production machines and data acquisition. They equip production companies worldwide with their systems which are able to be commanded over standard IT infrastructure.

Barix specially developed a component for Quinx which makes the networking to the machines possible.

The Barix module is easily interfaced and allows itself to be easily programmed on the computer screen to be configured for the machine it will communicate with. The module even offers RS-232 interface which is also programmable over the software.

With Barix Technology the machines can be commanded and monitored. Furthermore, all machine data, such as production units, run-time, down-time or any necessary information, can be gathered and processed using standard network infrastructure.

For further information, detailed technical specification and information about other versions and products please visit www.barix.com
