

Multi Room Audio Distribution

Mozart in the Bedroom, Madonna in the Bathroom and Eminem in the Fitness Room

Barix technology can turn every room into your desired concert by delivering personalized music in every room or area at any given time. The Instreamer transforms audio from centralized or decentralized sound sources such as a CD Player, tape recorder, tuner, radio or your home stereo into signals that are delivered onto the wired or wireless network and sent to their destination, whether it is next door or half way around the world!

At the destination points the Barix Exstreamers will retrieve the signals and transform them back to audio. You are able to control a central sound server from any room or area throughout the network by using the Exstreamer.

For playing the same music in every room, the Exstreamer has a synchronization function.

Management of the audio distribution system is also possible by using a PC. When the PC is utilized in the system, it allows the user to setup and receive internet radio stations and directs them in real-time to the designated Exstreamers as MP3 files.

Just as Barix technology does a great job distributing the audio at home, it does a great job distributing the audio for commercial applications such as hotels, fitness centers and more.

In fact, Barix has been rewarded for this system with an award for the "Best Distributed Audio Product" from the Consumer Electronic Association (CEA).
