

The Intercom That Connects Globally

The bigger and more populated buildings are, the more critical it becomes to be able to communicate to the people inside. At Barix, Intercom solutions are brought to life by offering customers a custom solution to perfectly fit their specific building communication and security needs.

The core of this system is the Barix Annunicom which opens a whole new world of functionality and application. The Annunicom can send announcements and emergency instructions over standard Network to the loudspeakers in the user selectable target zones.

In reverse it can be equipped with a call button, microphone, loudspeaker and a keyboard to allow people to communicate between zones or to contact a centralized zone such as the security office or rescue teams.

The Annunicom also offers additional functions such as the ability to remotely open or lock a door by connecting it to an electric door strike.

Flexible enough to meet every customer's needs, the Annunicom can be controlled locally or by a PC using Barix Annunicom software.

Intercom solutions with Barix maximize security and communication.
