

## From Autobahns to Highways, Barix is Ready

Barix has the ability to provide the Police and rescue teams with a longer arm to reach the people in need of assistance. With Annunicom, Barix has the ability to network all the civilian emergency communication from tunnel and highway emergency call stations to the designated emergency operators.

The Annunicom is the ideal state of the art component to replace the ancient technology found in emergency call stations on highways today.

The emergency operators now have the ability to easily manage these calls over a PC that transmits the caller's voice as well as the pinpoint geographic location of the call. All this information is automatically archived and available for quick audio playback so the dispatcher can focus on saving lives.

The Annunicom has the ability to be installed where it's needed the most such as highways, tunnels, elevators, large buildings, military installations and even utility boxes so that the workers can contact their headquarters directly. The possibilities are endless.
