3 Setting temporary IP address using ARP command

This procedure will work only in a local network. After this procedure the temporary IP will be active only until restart/reboot. After a restart this procedure has to be repeated.

STEP 1
Either use a network cable to link the Annuncicom and the PC directly, or connect the Annuncicom to the PC via your network switch and power the device. Make sure that you have a valid static IP address configured on your PC (e.g. 192.168.0.2).

STEP 2
Windows: For a command window: click on «Start», click on «Run..», in the «Open» field type cmd, click on «OK».
OSX / Linux: Open a terminal window.

STEP 3
Please proceed to step 4 if you linked the PC directly to the device in step 1. To ensure that you use a free IP address (not already used by another device in the network) please use the Ping command. To verify availability in this example we assume the PC to have the IP address «192.168.0.2» and want to check if «192.168.0.6» is free. Type ping 192.168.0.6 and hit the «Enter» key. You should get no reply which gives you reasonable assertion that the «pinged» IP is available.

STEP 4
Look for the Annuncicom’s MAC address printed on a label on the bottom of the device (12 hex digits, separated by a hyphen every 2 digits). Type into the windows command window:
arp -a 192.168.0.6 00-08-E1-00-B1-77
or on a OSX or Linux system type into the terminal:
arp -a 192.168.0.6 00:08:e1:00:b1:77
and hit the «Enter» key (replace the digits according to your devices MAC address). You must have administrative rights to be able to do so (sudo on OSX / Linux).

STEP 5
Now we have to make the Annuncicom listen to the IP address «192.168.0.6» using the Telnet command. To do so type into the command window: telnet 192.168.0.6 1 and hit the «Enter» key (the number «one» must be there for this command to work correctly!!!). The Annuncicom will immediately refuse the connection on port 1, but will be available for browser access as long as the device stays powered.

STEP 6
To check if the Annuncicom is responding you can use the ping command again. To do so type ping 192.168.0.6 and hit the «Enter» key. If you do get a reply the IP address 192.168.0.6 can be used to access the Annuncicom using a web browser. Please go back to section «2 Network configuration by web browser» to configure a static IP address. If you do get «request timed out» then please repeat step 5 carefully (you most likely mistyped the telnet command) or repeat the entire procedure. If the ARP method does not work for you, refer to the user manual for further methods.

4 Troubleshooting

• If the status LEDs (C) stay dark check the power cabling (installation step 3).
• Check if the green LINK LED (K) is lit, if it is not then check your network cabling (network port L).
• If you have doubts about the current device settings you can revert the device to its factory defaults by pressing the Reset button (A) until the red status LED (C) blinks rapidly (takes about 10 seconds). The device will reboot once the button is released.

# Installation

**STEP 1**
Plug a standard (straight) network cable (e, not included) into the network port (L) of the Annuncicom and the other end into your hub or switch. You can also use a crossover network cable (not included) for a direct connection to your PC.

**STEP 2**
Take a loudspeaker and wire it to the speaker output (H 5 & 6) using the 6-pin screw block terminal (b). Alternatively you can wire an adapter for a standard mini jack headset or headphones to the line output (F 3 & 4).

**STEP 3**
Unless you used a PoE capable switch in step 1 connect Power supply to the device (socket M or N) and then to an appropriate electrical outlet.

**STEP 4**

i) The Annuncicom will now acquire an IP address and announce it over the speaker output (if no DHCP server is available this can take up to 5 minutes).

ii) If you did not connect any audio outputs in step 2, either see the next page for the ARP command procedure, or use the “Barix Discovery Tool” Java application (download the latest version from www.barix.com) on your computer (Windows, Mac or Linux) and click the “Get” button to find out which IP address the device has obtained (see picture at the bottom of the page). Make sure that the Ethernet address (MAC) matches your device (see label on the bottom of the device).

Now that you know the IP address proceed to the next section “Network configuration by web browser”.

If you were not able to obtain the device’s current IP address with the previous steps see section “Troubleshooting”.

**Network configuration by web browser**

Most Barix applications require no configuration but use DHCP to configure network settings dynamically. If you need to use static (fixed) network settings follow steps 1 to 3, otherwise continue from step 4.

**STEP 1**
Open your web browser.

**STEP 2**
Enter the IP address that was announced by the Annuncicom and press Enter. Example: 192.168.0.12 Click on the Configuration button, then on Advances Settings/Network.

**STEP 3**
In order to make the application work the following parameters must be set (check with your network administrator):
- static IP address (the default «0.0.0.0» sets automatic DHCP to configure network settings dynamically).
- gateway IP address
- if you your devices are connected via routers also: static IP address (the default «0.0.0.0» sets automatic DHCP to configure network settings dynamically).

**STEP 4**
To complete the application setup, download the firmware application firmware.

As well as instructions on updating or changing the loaded application firmware.
